

- 1) I managed to get Project 2 to work as well. It is able to download datasets now. The next thing I need to fix is the path in the createLabel function in *preprocess_binclass.py*.
- 2) To get the project to work, I had to change downgrade yfiance version, otherwise yf.pdr_override would not work.
- 3) I had to change this:

```
# from tensorflow.keras.utils.np_utils import  
to_categorical to import np_utils
```
- 4) The readme.md from GitHub wants us to run the following code: `python runallfromlist.py. tw50.csv 20 50`, where tw50.csv is read, 20 is the window size and 50 is the number of dimensions. This finally runs the *run_binary_preprocessing.py* while iterating through each ticker it read from tw50.csv
- 5) *Run_binary_preprocessing.py* sets the training and testings data ranges, the ticker symbol window size and dimensions and then it runs *get_python.py* to download the data, also it runs *preprocess_binclass.py*, with args **createLabel**, which creates labels for the data, **ohlcv** which converts data to candlestick charts and **ohlcv2s** which associates the generated labels to the candlestick chart.
- 6) Now we describe *preprocess_binclass.py*. It has functions *createLabel* which are actually supposed to generate .txt labels for the images. Then *image2dataset* is supposed to organise images according to labels. *Ohlcv2s* has not been implemented yet.

Generated datasets
